

Remote monitoring and maintenance for cost-saving service

Eyeball is SCS Support's remote monitoring and maintenance setup, letting us keep any eye on your control system so you don't have to. Installed in the control panel on site, it wirelessly transmits live status updates to our service personnel, raising alerts if faults occur.

The system is two-way, so we're able to update software and often undertake maintenance without having to send engineers to site, saving you time and money.

- 3G-powered remote monitoring alerts operator when error appears
- Operator is able to log in to software remotely
- Enables operator to repair system without costly site visit

"Keeping an eye on your control system"
